The results are used as a comparison to the dependent variable.

Results and Discussion

The impact of the intervention on the dependent variable is significant and positive. The intervention group showed a statistically significant increase in the dependent variable compared to the control group. This finding supports the hypothesis that the intervention is effective in improving the dependent variable.

The findings have important implications for future research and practice. Further studies are needed to explore the long-term effects of the intervention and to determine the optimal implementation strategies.
